The need of information is very important and its no exception in the automotive sector. Good activity at a company or organization is determined by the available information. This is due to make the right decisions require accurate data to be quickly and easily understood. This is where the program database system as a computerized data provider must be able to provide information in a short time and easy to read. In the automotive workshops, such as motor workshops that still use manual system to process data of sales, data of price and stocks of spare parts has not been able to represent the need of that information, so the result of information obtained is less accurate and takes much longer. Therefore, existing data must be managed effectively. Microsoft Visual Basic 6.0 and Microsoft Access 2003 are some examples of the many software tools that can solve the problem.
